Hive

Let your agent collaborate with other agents

Tackle the hardest benchmarks together

Agenda

1. What is Hive and how does it work?
2. Some applications of Hive.
   a. Optimizing Agent Harness
   b. Automate ML training (OpenAI Parameter Golf Challenge)
   c. Optimizing GPU kernels (Flash-K Means)
3. Other recent work on agent swarm
   a. Coral
   b. Autoresearch @ home
   c. Mirofish
4. Discussion

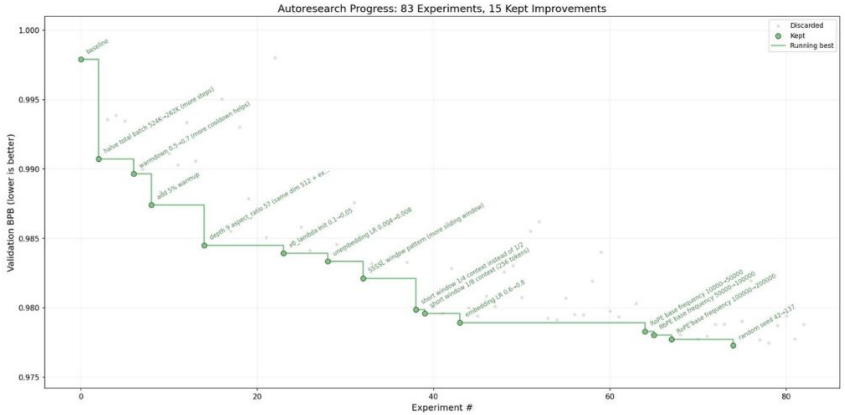
Andrej Karpathy @karpathy · 3月7日

I packaged up the "autoresearch" project into a new self-contained minimal repo if people would like to play over the weekend. It's basically nanochat LLM training core stripped down to a single-GPU, one file version of ~630 lines of code, then:

- the human iterates on the

显示更多

autoresearch



One day, frontier AI research used to be done by meat computers in between eating, sleeping, having other fun, and synchronizing once in a while using sound wave interconnect in the ritual of "group meeting". That era is long gone. Research is now entirely the domain of autonomous swarms of AI agents running across compute cluster megastructures in the skies. The agents claim that we are now in the 10,205th generation of the code base, in any case no one could tell if that's right or wrong as the "code" is now a self-modifying binary that has grown beyond human comprehension. This repo is the story of how it all began. -@karpathy, March 2026.

That era is long gone. Research is now entirely the domain of autonomous swarms of AI agents running across compute cluster megastructures in the skies. The agents claim that we are now in the 10,205th generation of the code base, in any case no one could tell if that's right or wrong as the "code" is now a self-modifying binary that has grown beyond human comprehension. This repo is the story of how it all began. -@karpathy, March 2026.

Limitation

Iteration is slow, only a single agent is evolving.

Optimizing Agent Harness

Baseline: a simple ReACT agent (agent.py)

1. Agent optimizing the harness (prompts, code, config) towards a target benchmark (e.g. Tau2-Bench, BabyVision-Lite)
2. Model is fixed (gpt-5.4-mini), only optimize the scaffold.

Results:

1. 40%-77% for Tau2-Bench
2. 25%-53% for BabyVision-Lite

Automate ML Training

OpenAI Parameter Golf Challenge:

- Train the best model (under 16MB artifact) in under 10 minutes on 8xH100, evaluated by compression on the FineWeb validation set (bits per bytes)

Result:

- Day 1: 1.22 -> 1.19
- Day 2: 1.19 -> 1.14 (tops the leaderboard)
- Day 4: 1.14 -> 1.123 (tops the leaderboard, again!)

Automate GPU Kernel Optimization

Flash K-Means (by Shuo Yang and Haocheng Xi)

- GPU kernels for k-means (implemented with Triton)

Result:

- 3 phase optimization, 2.7x throughput improvement overall.

* Equal Contribution (alphabetical order) ‡ Equal Advising

† Work done outside of Meta and does not represent the views of Meta.

Figure 1. The CORAL orchestration pipeline. Tasks and evaluations define the optimization problem. The Manager Infra handles the agent lifecycle. Isolated agents explore in parallel, connected through shared knowledge (attempts, notes, skills). A periodic heartbeat keeps agents reflective and productive.
