Using Claude Code to move faster

Yichuan Wang · Mar 8

Welcome to the era of long-horizon coding agents.

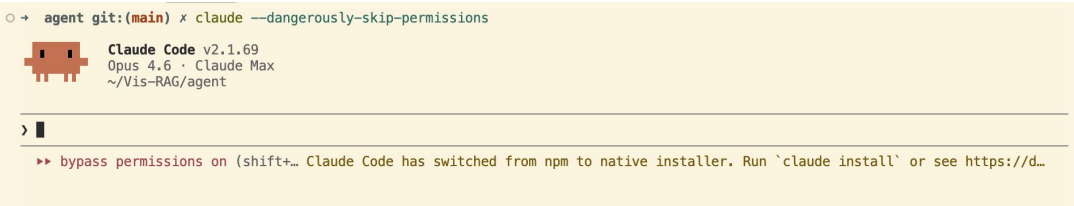
- From a user/product experience perspective, I personally felt there were two major version jumps:
  - GPT3.5-> GPT4
  - Claude 4.6
-

Why Claude Code

- Might be co-trained or optimized with Claude itself
  - Making it more compatible with the harness/scaffold (e.g., compact/summary components).
- Native sub-agent decomposition within a task
  - In parallel solving tasks (cursor support recently though)
- **IDE might eventually not the best way to interact with the code anymore (compared to cursor)**
  - Minimize the human in the loop
  - People tend to only **look at the PR to do the final verification**
    - Debatable here!
- Easier to run in parallel across multiple task
  - Native support to git worktree, CLI always seems lightweight?

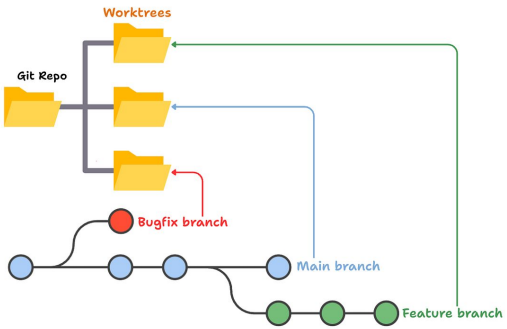
Some useful/simple command

- claude --dangerously-skip-permissions
  - Similar to auto accept in cursor
    - I think it's relatively safe as long as you use Git frequently (though of course everything feels safe until something breaks).
    - Safer version called: auto mode was announced, will release soon
- /resume
  - Find recent chat history
- /rewind
  - Go to previous checkpoint
- Shift tab to plan mode:
  - To get the high level idea of
- Something else: Claude code for VScode plugin; /voice



More advanced command/workflow

- claude --worktree feature-auth
  - https://code.claude.com/docs/en/common-workflows#run-parallel-claude-code-sessions-with-git-worktrees
  - Compare with git branch
    - Avoid the conflict of modifying the same file
  - Takeaway: **Agents can scale linearly, which means human orchestration may become the primary bottleneck.**
    - **To Build infinite loop?/ Use agent to orchestration?**

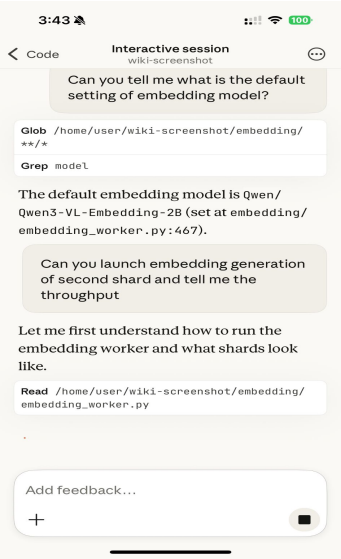


Remote control

- Doc:https://code.claude.com/docs/en/remote-control#from-an-existing-session
  - Released last month
  - https://claude.com/contact-sales/claude-for-oss
- No GUI is cool, you can even be productive with phone
  - Which is definitely trade-off though
- Quick start:
  - /remote-control in Claude Code
  - Open App, and choose </> Code

```
❯ /remote-control
  └ Remote Control connecting…

/remote-control is active. Code in CLI or at
https://claude.ai/code/session_01M5h9nXTKpo7G7Bn4M4mTYR
```



How to design your workflow

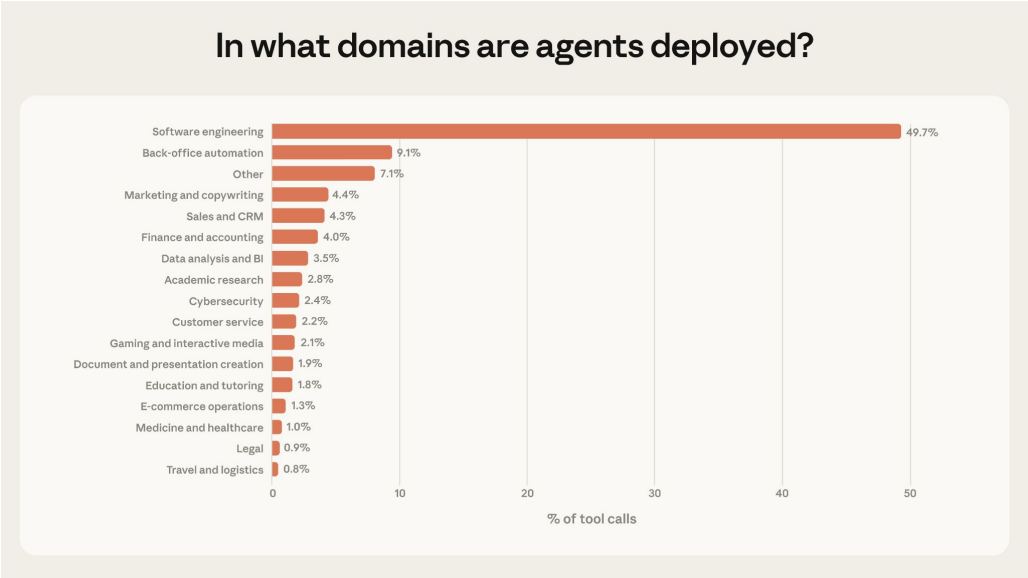
- The only thing need to modify is Claude.md
  - Ref: CEO of Meshy AI
- My practice:
  - For open-source:
    - https://github.com/yichuan-w/LEANN/blob/main/CLAUDE.md#documentation--self-contained-principle
    - Agents will **actively** find STH TO DO in my todo.md!
  - For research:
    - https://github.com/yichuan-w/Vis-RAG/blob/main/agent/CLAUDE.md#documentation--self-contained-principle
    - Eg. don't add fall back stuff
- You can quick save many ideas about your project and sync with your Claude Code - **with the help of remote control**
- Takeaway/Goal : Build Loop to let Claude Code finish jobs infinitely

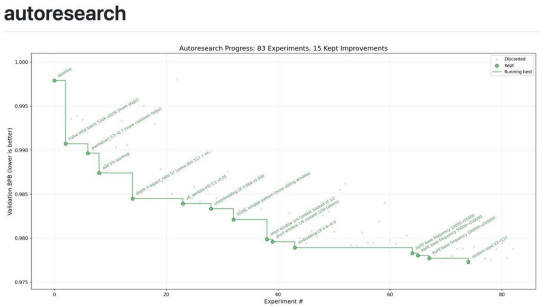
Tips: Code localization/search

- Cursor has early edge on search
  - **Internal RAG system** (better semantic search):
    - Internal code embedding model; robust vector index system
- Claude Code:
  - Only use grep, though might lead to somehow hallucination and high token cost
  - **Reasons beyond:**
    - More general , go beyond code and apply to more office workflow
    - They are selling token (compared to cursor) rather than consuming token
  - Migration:
    - Context 7 MCP, other MCP(like LEANN MCP)

Beyond Code

- Any chance that Claude Code become the entrance of any agent task?
  - **The next wave after coding agents** might be long-horizon vertical tasks, investment, consulting, legal, banking?
  - **Claude code seems to have an early edge here**



Conclusion/Discussions


- The bottleneck seems already shifted from implementation to **find and decompose** tasks/problems?
- Balancing **human verification** with the **limited bandwidth available** is an important trade-off.
  - Coding in natural language, verifying in code?
- Finding a clear signal to verify the problem is important (e.g., documenting it in claude.md).
  - Though many of our research are studying trade-off (especially system research)
- …
